

Societal Innovation Portal — Demo Script (Pitch Version)

Team: Genesis Codex | What you're watching: A working prototype

The Problem (30 seconds)

Every day, people in Jharkhand face problems — broken water systems, bad roads, empty schools, no hospitals nearby. They know about these problems. But there's no way to get those problems to the people who can actually fix them — universities, companies, the government.

Today, we show you a platform that fixes that.

Scene 1: A Citizen Reports a Problem (2 minutes)

A mother in a village notices the water tap has been dry for 3 months. Her children are getting sick. She opens our app on her phone.

What she does:

- Types in: "Water tap broken in my village for 3 months"
- The app **automatically understands** this is a water problem — she doesn't need to know the right category
- She adds her location — the map finds her village
- She takes a photo and uploads it
- She hits submit

What happens next (this is the magic):

- Our AI instantly searches for: Has this problem been reported before? Are there government schemes that could help? Have other villages solved this? Are there academic papers on fixing this?
- Within seconds, the problem gets a **trust score** — is this real? Is it documented? How serious is it?
- It gets **categorized automatically** — Water Resources
- It gets **checked for duplicates** — is someone else already working on this?

The citizen doesn't see any of this complexity. She just submitted a problem and got a confirmation.

Scene 2: The System Figures Out Who Can Help (1 minute)

Our platform knows which universities are good at what. It doesn't just send the problem somewhere random — it sends it to the **right place**.

What happens:

- The system looks at: Which university has water experts? Which one has done similar projects? Which one has the labs and facilities?
 - It picks: **BIT Mesra's Environmental Engineering department** — they've done 3 water projects before, they have the right professors, they have a 94% match score
 - The university gets notified instantly
-

Scene 3: The University Gets to Work (2 minutes)

The university opens their dashboard. They see the problem assigned to them — with **everything they need already collected**.

What they see:

- The original problem (from the citizen)
- All the research our AI already did: similar problems elsewhere, government schemes, academic papers, case studies from other villages
- A **trust score** showing how solid this problem is
- They form a team: 2 engineering students, 1 public health student, 1 professor as mentor
- They set milestones: Research by Week 2, Prototype by Month 2, Testing by Month 3

The team uses our built-in research tool to dig deeper — searching for purification technologies, cost comparisons, installation guides. Every piece of information they find gets added to the project as evidence.

Scene 4: Industry Partners Join In (1 minute)

Now the university needs money and expertise to actually build and deploy the solution.

Our platform suggests the best partners:

- **Tata Trusts** — they've funded 12 similar water projects
- **Piramal Foundation** — they work on healthcare and water in Jharkhand
- **A local pump company** — they can provide equipment at cost

The university sends a proposal to Tata Trusts through the platform. Tata Trusts can see the full project — the citizen's problem, the AI research, the university team, the milestones. Everything is transparent.

Tata Trusts says yes. Rs. 15 lakhs for prototyping and deployment.

Scene 5: The Government Sees Everything (1.5 minutes)

A district collector opens the dashboard. They don't just see this one problem — they see **everything happening across Jharkhand**.

What they see:

- **1,247 problems** reported by citizens so far
- **892 validated** by our AI
- **345 being worked on** by universities
- **89 solutions already deployed**
- A **map** showing which districts have the most problems
- A **chart** showing water is the #1 issue, followed by healthcare, then agriculture
- A **trend line** showing submissions going up — more people are trusting the platform
- A **leaderboard** — which universities are most active, which districts are most engaged

This isn't just a dashboard. This is the government seeing their state's problems being solved in real time.

Scene 6: The Impact (30 seconds)

Let's trace this one problem from start to finish:

- **Monday:** Citizen submits the broken water tap problem
- **Tuesday:** AI validates it, finds government schemes, routes it to BIT Mesra
- **Friday:** University forms a team, starts researching
- **Month 1:** Team visits the village, tests the water, designs a solution
- **Month 2:** Prototype built with Tata Trusts funding
- **Month 3:** Installed and tested
- **Result:** 500 households, 2,000 people, clean drinking water

One citizen. One problem. One platform. Real change.

What Makes This Different

What others do

Collect problems in a form
Send problems to anyone
Hope someone solves it
Government sees reports
Once a problem is logged, it's forgotten

What we do

Research every problem with AI before routing
Smart matching — right university, right expertise
Track everything — milestones, funding, deployment
Government sees **live dashboards** with real data
Every solution is evidence-backed with citations

The Numbers That Matter

- **24 districts** in Jharkhand covered
 - **50+ universities** ready to participate
 - **10 problem categories** — water, health, education, agriculture, environment, energy, urban, accessibility, governance, livelihoods
 - **3 stakeholders connected** — citizens, universities, industry
 - **1 mission** — turn community problems into real solutions
-

One-Line Pitch

"We built an AI-powered platform that takes a citizen's problem, researches it, validates it, connects it to the right university, finds industry funding, and tracks the solution all the way to deployment — with evidence at every step."

If They Ask "Why Should We Care?"

Because right now:

- A mother reports a broken water tap → nobody follows up
- A university has brilliant students → no real problems to work on
- A company wants to do CSR → no way to find the right project
- A collector wants to help → no visibility into what's working

With our platform:

- The mother's problem gets researched, validated, and solved
- Students work on real issues that affect real people

- Companies fund projects with transparent impact tracking
- Collectors see exactly what's working and what needs attention

We're not building another app. We're building the connection between people who have problems and people who can solve them.
